Abstract A new acetyl phosphorylamide $P(O)[NH-C(O)C_6H_4(4-NO_2)][N(CH(CH_3)_2)(CH_2C_6H_5)]_2$ has been synthesized and characterized by elemental analysis, 1H , ^{13}C and ^{31}P NMR, IR and single crystal X-ray diffraction. Single crystal X-ray analysis shows that it belongs to triclinic system, space group $P\bar{1}$, with $a = 10.5868(16)$ Å, $b = 11.8058(18)$ Å, $c = 12.4364(19)$ Å, $\alpha = 65.410(3)$ °, $\beta = 67.492(4)$ °, $\gamma = 85.879(3)$ °, $V = 1,298.6(3)$ Å 3 , and $Z = 2$. The intermolecular $PO\cdots HN$ hydrogen bond makes H-bonded dimer of molecule with C_i symmetry. In the crystal network, the dimers are aggregated in the chain arrays through π -stacking between $p-NO_2-C_6H_4-C(O)-NH-$ moieties. Moreover, weak C–H \cdots O and C–H \cdots π interactions exist in the crystal network.

Introduction

Acetyl phosphorylamides, containing $C(O)N(H)P(O)$ moiety have attracted special interest because of bearing a close structural resemblance to the β -diketone frame and acting as effective chelating ligands [1], having biological properties [2, 3] and urea inhibition [4]. In the previous work, the

synthesis and crystal structures of N -benzyl-2-propanaminium O -methyl trichloroacetamidophosphate, $[NH_2(CH(CH_3)_2)(CH_2C_6H_5)][P(O)(NHC(O)CCl_3)O(OCH_3)]$ and N -benzyl-propan-2-aminium (benzylisopropylamido)(2,2,2,-trifluoroacetamido) phosphate $[NH_2(CH(CH_3)_2)(CH_2C_6H_5)][P(O)(NHC(O)CF_3)O(N(CH(CH_3)_2)(CH_2C_6H_5))]$ have been reported [5, 6]. In this paper, we report on the synthesis of a new acetyl phosphorylamide $P(O)[NHC(O)C_6H_4(4-NO_2)][N(CH(CH_3)_2)(CH_2C_6H_5)]_2$ (Fig. 1) from the reaction between $4-NO_2-C_6H_4C(O)NHP(O)Cl_2$ and $NH(CH(CH_3)_2)(CH_2C_6H_5)$. Characterization was done by elemental analysis, 1H , ^{13}C and ^{31}P NMR, IR and single crystal X-ray diffraction.

Experimental

Instruments and Materials

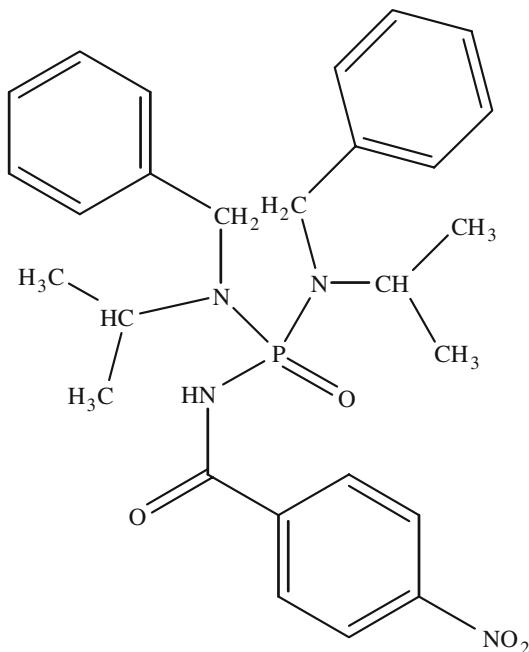

All chemicals were purchased commercially and used without further purification. 1H , ^{13}C and ^{31}P NMR spectra were determined on a Bruker Avance DRS 500 spectrometer. 1H and ^{13}C chemical shifts were determined relative to internal TMS, ^{31}P chemical shift relative to 85% H_3PO_4 as external standard. Infrared (IR) spectrum was recorded on a Shimadzu model IR-60 spectrometer. Elemental analysis was performed using a Heraeus CHN-O-RAPID apparatus.

Preparation of the Title Compound

The reaction of phosphorus pentachloride (4.165 g, 20 mmol) and 4-nitrobenzamide (3.323 g, 20 mmol) in dry CCl_4 (70 mL) at 80 °C (3 h) and then the treatment of formic acid (0.921 g, 20 mmol) at room temperature leads

to $4\text{-NO}_2\text{-C}_6\text{H}_4\text{C(O)NHP(O)Cl}_2$. The solid $(4\text{-NO}_2\text{-C}_6\text{H}_4\text{C(O)NHP(O)Cl}_2)$ was washed with dry CCl_4 . To a solution of (0.708 g, 2.5 mmol) $4\text{-NO}_2\text{-C}_6\text{H}_4\text{C(O)NHP(O)Cl}_2$ in CCl_4 (40 mL), a solution of *N*-isopropylbenzylamine (1.492 g, 10 mmol) in CCl_4 (10 mL) was added dropwise at 0 °C. After 24 h, the solvent was removed in vacuum and the solid was washed with distilled water. The residue recrystallized in $\text{CH}_3\text{CN}-\text{CH}_3\text{OH}$. *Anal.* Calc. for $\text{C}_{27}\text{H}_{33}\text{N}_4\text{O}_4\text{P}$: C, 63.77; H, 6.54; N, 11.02. determination are presented in Table 1. Data were collected at 120 K on a Bruker SMART 1000 CCD [7] single crystal diffractometer with graphite monochromated Mo K α radiation ($\lambda = 0.71073$ Å) in the range of $1.91^\circ < \theta < 27.00^\circ$. The structure was refined with SHELXL-97 [8] by full matrix least squares on F^2 . The hydrogen atom of NH group was found in difference Fourier synthesis. The H(C) atom positions were calculated. All hydrogen atoms were refined in isotropic approximation in riding model with the $U_{iso}(\text{H})$ parameters equal to 1.2 $U_{eq}(\text{C}_i)$, for methyl groups equal to 1.5 $U_{eq}(\text{C}_{ii})$, where $U(\text{C}_i)$ and $U(\text{C}_{ii})$ are respectively the equivalent thermal parameters of the carbon atoms to which corresponding H atoms are bonded. A semi-empirical absorption correction was performed using the SADABS program [9].

Results and Discussion

Description of the Crystal Structure

Single crystals of title compound were obtained from a solution of CH₃CN–CH₃OH after slow evaporation at room temperature. The final atomic coordinates and equivalent isotropic displacement parameters and selected geometric parameters are given in Tables 2 and 3. The phosphoryl

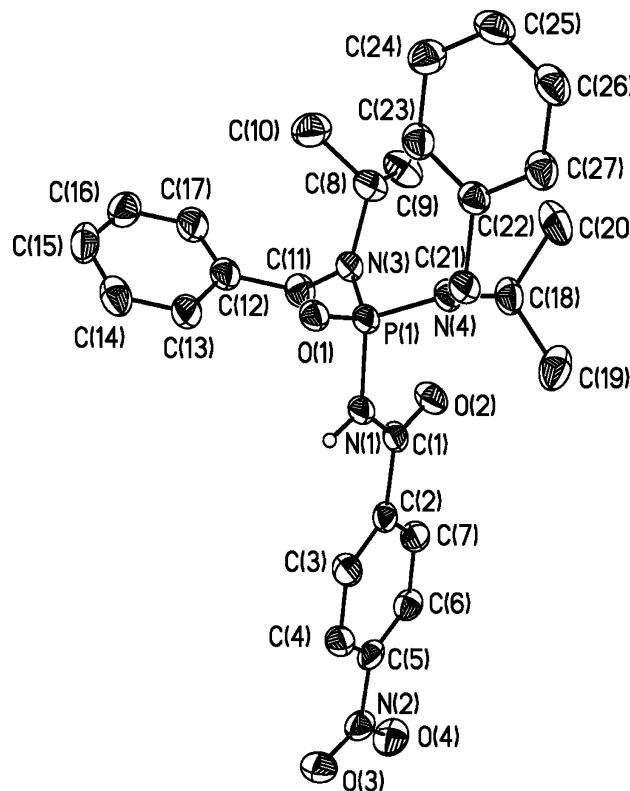

Fig. 2 Molecular structure of P(O)[NHC(O)C₆H₄(4-NO₂)][N(CH(CH₃)₂)(CH₂C₆H₅)₂] in representation of atoms via thermal ellipsoids at 50% probability level (all hydrogen atoms except H(1N) are omitted for clarity)

and the carbonyl groups are *anti* and the phosphorus atom has a slightly distorted tetrahedral configuration (Fig. 2). The bond angles around the P atom are in the range of 104.71(11)°–118.24(10)°. P(1)–N(3) and P(1)–N(4) bond lengths (1.636(2) Å and 1.644(2) Å) are significantly

shorter than the typical P–N single bond length (1.77 Å) [10]. The shortening of P–N bond lengths is likely related to an electrostatic effect (polar bond) which overlaps with P–N σ bond [11]. The P(1)–N(1) bond length (1.694(2) Å) is longer than the P(1)–N(3) and P(1)–N(4) bond lengths due to the resonance interaction of N(1) nitrogen atom lone pair with the C=O system (and less interaction with P=O) that causes a partial multiple bond character in N(1)–C(1) (compare N(1)–C(1) with other N–C bond lengths (Table 3). The environment of the nitrogen atoms is practically planar. In the title compound, the angles C(11)–N(3)–C(8), C(11)–N(3)–P(1) and C(8)–N(3)–P(1) are 116.2(2) $^\circ$, 121.79(17) $^\circ$ and 120.08(17) $^\circ$, respectively (with average 119.4 $^\circ$). A similar result was obtained for the bond angles around N(4) atom (average = 119.7 $^\circ$). Furthermore, the angle C(1)–N(1)–P(1) is 126.67(17) $^\circ$. These results confirm the sp^2 hybridization for the nitrogen atoms, although due to repulsion and steric interactions and electronic effect, some angles are greater and the others are smaller than 120 $^\circ$. The P=O bond length, 1.4801(17) Å, is longer than the normal P=O bond length (1.45 Å) [10]. The amidic hydrogen atom of title compound is involved in intermolecular –P=O···H–N– hydrogen bond (Fig. 3; Table 4) to form a dimer with Ci symmetry (centrosymmetric dimer). The donor···acceptor distances for the –P=O···H–N hydrogen bond in the title compound is in the range of the values which have been observed for the other phosphoramidate compounds, Table 5. H-bonded dimers in the crystal structure form chains through π -stacking between *p*-NO₂–C₆H₄–C(O)–NH– moieties (see the

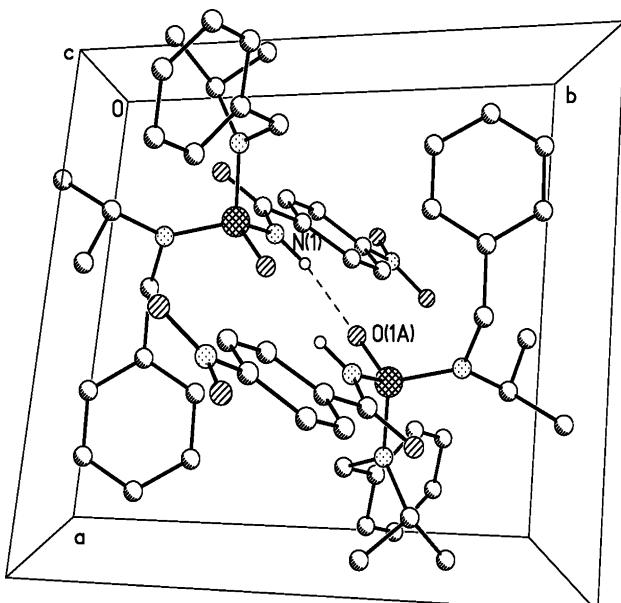

Fig. 3 The fragment of crystal packing of P(O)[NHC(O)C₆H₄(4-NO₂)][N(CH(CH₃)₂)(CH₂C₆H₅)]₂ along the crystallographic plane *ab* (all hydrogen atoms except H(1N) are omitted for clarity)

orientation of these moieties in crystal packing, Fig. 4). The planes of *p*-NO₂–C₆H₄–C(O)–NH– moieties of neighboring molecules are parallel (0.0(1) $^\circ$) and are situated at 3.36(2) Å from each other; compare it with the distance between the planes of *p*-H₃C–C₆H₄–NH moieties (3.26(1) Å [20]) in [(CH₃)₂N][*p*-H₃C–C₆H₄–O]P(O)[*p*-H₃C–C₆H₄–NH]. The π -stacking between *p*-NO₂–C₆H₄–C(O)–NH– moieties is off-center stacking, the distance between the centers of the interacting phenyl rings is 4.046(4) Å. The concept of H bonds has been extended to C–H···Y bonding (where Y is an electronegative atom or the π system [21, 22]). Previous studies have suggested that C–H···O hydrogen bonds occur in the range of 3.0–4.0 Å for C···O distances and more than 110 $^\circ$ for the bond angles [23, 24]. Figure 5 indicates a view of normal N(1)–H(1N)···O(1) and weak C(3)–H(3A)···O(1) and C(15)–H(15A)···O(2) hydrogen bonds. The weak C–H···O hydrogen bonds in the title compound [C(3)···O(1) = 3.165(3) Å, $\angle C$ –H–O = 155.6 $^\circ$ and C(15)···O(2) = 3.517(3) Å, $\angle C$ –H–O = 157.7 $^\circ$] are in the range of the previous results for the phosphoryl compounds, for example in P(O)(OCH₃)₂(NHC₆H₄(4-NO₂)): C(sp²)···O(phosphoryl) = 3.352 Å and C(sp³)···O(nitro) = 3.302 Å [25] and in P(O)[4-CH₃–C₅H₉N]₂[NHC₆H₄(4-NO₂)]: C(sp²)···O(phosphoryl) = 3.288 Å, C(sp³)···O(nitro) = 3.429 and 3.435 Å [13]. A view of C(7)–H(7A)··· π and C(25)–H(25A)··· π interactions is given in Fig. 6 [r(C(7)···meanplane) = 3.562(3) Å, r(H(7A)–C(25)) = 2.854 Å, $\angle C$ –H–C = 137.2 $^\circ$ and r(C(25)···meanplane) = 3.467(4) Å, r(H(25)–C(15)) = 2.884 Å, $\angle C$ –H–C = 131.7 $^\circ$]. The C–H bond points away from the ring although the hydrogen is close to a carbon (type VI C–H··· π interaction according to the classification of Malone et al. [26]). The distances of interacting H atoms to phenyl ring centroid (3.44 and 3.53 Å) in P(O)[NHC(O)C₆H₄(4-NO₂)][N(CH(CH₃)₂)(CH₂C₆H₅)]₂ are more than the values for [P(O)(O)(NHC(O)CF₃)(N(CH(CH₃)₂)(CH₂C₆H₅))]NH₂(CH(CH₃)₂)(CH₂C₆H₅)] (3.26 Å [6]) and [(CH₃)₂N]P(O)[NH(iso-C₃H₇)][*p*-OC₆H₄–CH₃] (3.31 Å) [19].

Spectroscopic Characterization

As can be seen in X-ray structure of the title compound, the P=O···H–N_{amide} hydrogen bond leads to a dimeric aggregate in the solid state, which means the phosphoryl oxygen

^a Compound contains four independent molecules in crystal lattice

^b Two independent molecules

^c The first D···A distance in the table is related to P=O···H-N_{amide}, two others are related to P=O···H-N_{amine}

Fig. 4 A view of H-bonded dimers with Ci symmetry and the chain array through π -stacking between p-NO₂-C₆H₄-C(O)-NH- moieties

atom is the better H-acceptor than the carbonyl oxygen atom. This finding is in agreement with the theoretical studies on compounds with $-P(O_p)XC(O_c)-$ system. The theoretical investigation shows that the O_p atom is a better electron donor relative to the O_c counterpart as a result of the more partial negative charge (δ^-) on the O_p atom relative to the O_c [27]. In title compound, the $\nu(C=O)$ stretching frequency appears at 1,661 cm⁻¹ wave number. The frequency of the N–H stretching vibration ($\tilde{\nu}_{N-H}$) is

very sensitive to the formation of hydrogen bonding (red-shift of the absorption band, band broadening or intensification). For N–H···O hydrogen bonds, the $\tilde{\nu}_{N-H}$ is depending on the H-bond strength or donor–acceptor distance (N···O). For title compound, the band at 3,050 cm⁻¹ is assigned to N–H_{amide}. The wave number is close to the ones which have been observed for ClF₂CC(O)NHP(O)Cl₂ and CF₃C(O)NHP(O)Cl₂ (3,064 and 3,093 cm⁻¹) [28, 29]. This relative low wave number for

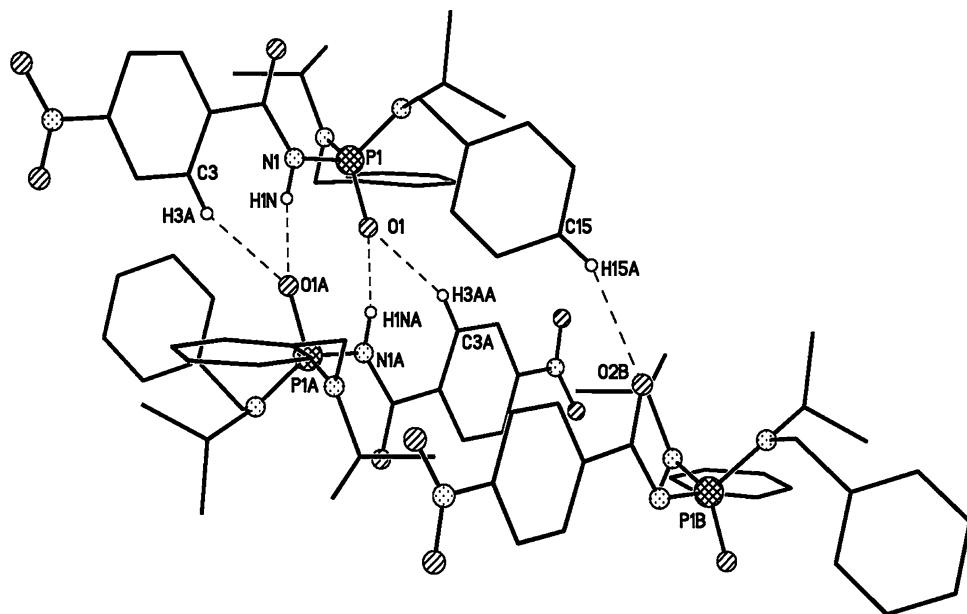

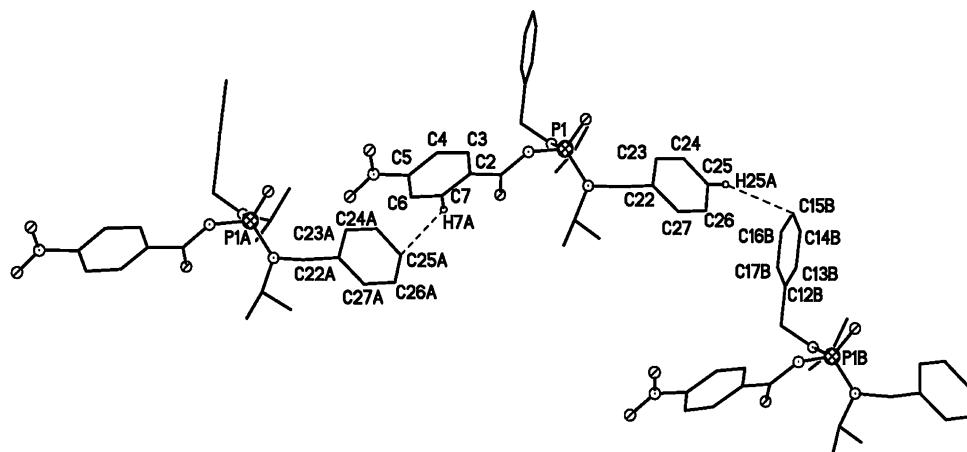

Fig. 6 A view of C–H···π interactions in the crystal network

an N–H stretching vibrational mode can be explained by the N–H···O intermolecular interactions as reported on related acetyl phosphorylamide compounds [28]. The NH_{amide} is placed between two withdrawing groups (PO and CO) which causes an increase in the acidity of the H atom. Appearance of the NH_{amide} signal at 9.65 ppm in ¹H NMR spectrum confirms this fact. Moreover, the phosphorus–hydrogen coupling constant, ²J(PNH) was not observed. The P–C coupling constants give rise to two doublet signals for two non-equivalent methyl carbon atoms of isopropyl moieties at 21.46 ppm (³J(P,C) = 2.7 Hz) and 21.90 ppm (³J(P,C) = 2.8 Hz). Moreover, the CH and CH₂ carbon atoms show P–C coupling constants at 45.53 ppm (²J(P,C) = 5.1 Hz) and 47.64 ppm (²J(P,C) = 5.0 Hz), which means that for these aliphatic carbon atoms ²J(P,C) > ³J(P,C). Also, the *ipso* C atoms of the phenyl moieties show P–C coupling constants (³J(P,C) = 2.4 and 8.9 Hz). Phosphorus chemical shift in the title compound was observed at 14.29 ppm in ³¹P NMR spectrum.

Supplementary Material

CCDC 696934 contains the supplementary crystallographic data for this paper. These data can be obtained free of charge at www.ccdc.cam.ac.uk/conts/retrieving.html or from the Cambridge Crystallographic Data Centre (CCDC), 12 Union Road, Cambridge CB2 1BZ, UK, Fax: +44-1223-336033, e-mail: deposit@ccdc.cam.ac.uk.

Acknowledgments Support of this investigation by Islamic Azad University-Zanjan Branch is gratefully acknowledged.
