#### Abstract

This open-access article is distributed under the terms of the Creative Commons Attribution Licence http://creativecommons.org/licenses/by/2.0/uk/legalcode, which permits unrestricted use, distribution, and reproduction in any medium, provided the original authors and source are cited.

Acta Crystallographica Section E: Structure Reports Online is the IUCr's highly popular open-access structural journal. It provides a simple and easily accessible publication mechanism for the growing number of inorganic, metal-organic and organic crystal structure determinations. The electronic submission, validation, refereeing and publication facilities of the journal ensure very rapid and high-quality publication, whilst key indicators and validation reports provide measures of structural reliability. In 2007, the journal published over 5000 structures. The average publication time is less than one month.

Correspondence e-mail: haghabozorg@yahoo.com
Received 3 October 2010; accepted 1 December 2010
Key indicators: single-crystal X-ray study; $T=298 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.006 \AA$; $R$ factor $=0.059 ; w R$ factor $=0.218 ;$ data-to-parameter ratio $=13.9$.

In the title adduct, $3 \mathrm{C}_{13} \mathrm{H}_{9} \mathrm{~N} \cdot \mathrm{C}_{9} \mathrm{H}_{6} \mathrm{O}_{6}$ or $(\mathrm{acr})_{3}(\mathrm{btc})$, associations of one btc and three acr molecules linked by $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds occur. $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions also occur, resulting in a cyclic hydrogen-bonded synthon $R_{2}^{1}(6)$. The acr molecules and the btc molecules also form slipped or offset $\pi-$ $\pi$ stacking interactions [centroid-centroid distances of 3.5212 (17) $\AA$ for btc rings and 3.703 (2) and 3.731 (2) $\AA$ for acr rings]. Together these interactions lead to a threedimensional network.

## Acridine-benzene-1,3,5-tricarboxylic acid (3/1)

## H. Aghabozorg, S. Goodarzi, M. Mirzaei and B. Notash

## Comment

Acridine is structurally related to anthracene wherein one of the central CH group is replaced by nitrogen. It is a raw material used for the production of dyes and some valuable drugs. Our research group has recently reported two proton transfer complexes with acridine (Tabatabaee et al., 2009; Eshtiagh-Hosseini et al., 2010). Recently, Dale et al. reported the structure of btc with three pyridines as a cocrystal (Dale et al., 2004). In this article, we report the crystal structure of a new cocrystal system containing acridine and benzenetricarboxylic acid, for the first time.

The title cocrystal structure contains acridine and benzene-1,3,5-tricarboxylic acid in 3:1 molar ratio in the asymmetric unit (Fig. 1). These three bases and one acid formed a cocrystal without any proton transfer. Hence, the acr molecules interact with the carboxylic acid groups of the respective btc molecule through $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Table 1). The latter formed a cyclic hydrogen-bonded synthon $R_{2}^{1}(6)$. The acr molecules and also btc molecules form slipped or offset $\pi-\pi$ stacking interactions [with centroid $\cdots$ centroid distances of 3.5212 (17) $\AA$ for btc rings and 3.703 (2) and 3.731 (2) $\AA$ for acr rings]. The dihedral angle of the plane of three carboxylate groups with respect to plane of the central benzene ring in btc are equal to $3.17,6.46$ and $6.52^{\circ}$. Indeed, the crystal structure is stabilized by an extensive series of intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds and $\pi-\pi$ stacking interactions, forming a three-dimensional network (Fig. 2).

## Experimental

The reaction between a solution of benzenetricarboxylic acid ( $70 \mathrm{mg}, 0.30 \mathrm{mmol}$ ) in 5 ml ethanol and acridine ( $180 \mathrm{mg}, 1.0$ mmol) in 5 ml ethanol in 1:3 molar ratio at 298 K for 4 hr gave orange block crystals of $(\mathrm{acr})_{3}(\mathrm{btc})$ after slow evaporation of the solvent at room temperature (m.p. $>260^{\circ} \mathrm{C}$ ).

## Refinement

The hydrogen atoms of the carboxylic part of btc molecule were found in a diference Fourier map and refined isotropically without restraint. All of the other H atoms were positioned geometrically and refined as riding atoms, with $\mathrm{C}-\mathrm{H}=0.93$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$.

## Figures

Fig. 1. The molecular structure of the title compound with displacement ellipsoids drawn at $30 \%$ probability level.

Fig. 2. The crystal packing of the title compound along $b$ axis. The figure shows the parallel arrangements between centro-symmetry related aromatic rings [symmetry code: (i) $1-\mathrm{x},-\mathrm{y},-1-$ z; (ii)-1-x, 1-y, -z; (iii) -x, -1-y, 1-z; (iv) -x,-y,-z].

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.059$
$w R\left(F^{2}\right)=0.218$
$S=0.95$
7305 reflections
526 parameters
0 restraints

Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}{ }^{2}\right)+(0.1227 P)^{2}\right]$
where $P=\left(F_{\mathrm{o}}{ }^{2}+2{F_{\mathrm{c}}}^{2}\right) / 3$
$(\Delta / \sigma)_{\max }=0.001$
$\Delta \rho_{\max }=0.32 \mathrm{e}_{\AA^{-3}}$
$\Delta \rho_{\min }=-0.34 \mathrm{e}^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.

Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$ factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
