Received 23 March 2011; accepted 26 April 2011

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.032; wR factor = 0.094; data-to-parameter ratio = 18.4.

In the title compound, $\text{C}_{17}\text{H}_{24}\text{N}_3\text{O}_3\text{PS}$, the P and the S atoms are each in a distorted tetrahedral environment and the N atoms display sp^2 character. The phosphoryl group and the NH unit are *anti* with respect to one another. The dihedral angle between the mean planes of the benzene rings is $31.08(8)^\circ$. The crystal packing is stabilized by $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds, forming an extended chain parallel to the *b* axis.

Comment

Structure determination of the title compound, $\text{CH}_3\text{S}(\text{O})_2\text{NHP(O)}[\text{N}(\text{CH}_3)(\text{CH}_2\text{C}_6\text{H}_5)]_2$ (Fig. 1), was performed as a part of a project in our laboratory on the synthesis of new phosphoramidate compounds having a $\text{P(O)}[\text{N}(\text{CH}_3)(\text{CH}_2\text{C}_6\text{H}_5)]_2$ moiety (Pourayoubi *et al.*, 2010).

The $\text{P}=\text{O}$ and $\text{P}-\text{N}$ bond lengths are comparable to those in similar phosphoramidates of the formula $\text{XP(O)}[\text{N}(\text{CH}_3)(\text{CH}_2\text{C}_6\text{H}_5)]_2$ [where $X = \text{Cl}, \text{C}_6\text{H}_5\text{C(O)NH}, \text{CCl}_3\text{C(O)NH}$] (Gholivand *et al.*, 2005). The $\text{P}-\text{N}1$ and $\text{P}-\text{N}2$ bonds (with bond lengths of 1.6326 (17) Å and 1.6285 (18) Å) are shorter than the $\text{P}-\text{N}3$ bond (1.6714 (15) Å). The $\text{S}=\text{O}$ bond lengths of 1.4317 (16) Å & 1.4287 (18) Å are standard for sulfonamide compounds (Ibrahim *et al.*, 2011).

Each of the phosphorus and sulfur atoms has a distorted tetrahedral configuration. The surrounding bond angles are in the range of 104.84 (9)° to 117.02 (9)° around the P atom and 104.79 (12)° to 118.53 (12)° for the S atom. The average of surrounding angles around the tertiary nitrogen atom N2 (which is about 120°) shows that it is bonded in an essentially planar geometry; whereas, the environment of N1 is slightly deviated from planarity (average of bond angles is 118.3°). Furthermore, the S—N3—P angle is 125.05 (9)°. The dihedral angle between the mean planes of the benzene rings is 31.08 (8)°.

The phosphoryl group and the NH unit adopt the *anti* orientations with respect to each other. Crystal packing is stabilized by N—H···O hydrogen bonds, forming an extended chain parallel to the *b* axis (Fig. 2).

Experimental

$\text{CH}_3\text{S}(\text{O})_2\text{NHP(O)}\text{Cl}_2$ was synthesized from the reaction between phosphorus pentachloride (16.7 mmol) and methanesulfonamide (16.7 mmol) in dry CCl_4 at 353 K (3 h) and then treated with formic acid 85% (16.7 mmol) at ice bath temperature.

To a solution of $\text{CH}_3\text{S}(\text{O})_2\text{NHP(O)}\text{Cl}_2$ (2.35 mmol) in dry chloroform (30 ml), a solution of *N*-methylbenzylamine (9.40 mmol) in the same solvent (10 ml) was added at ice bath temperature. After 4 h stirring, the solvent was removed and the product was washed with distilled water and recrystallized from $\text{CH}_3\text{CN}/\text{CHCl}_3$ at room temperature.

Refinement

H atoms were placed in calculated positions and included in the refinement in a riding-model approximation with $\text{CH} = 0.93$, $\text{CH}_2 = 0.97$, $\text{CH}_3 = 0.96$ Å or $\text{N}—\text{H} = 0.86$ Å with $U_{\text{iso}}(\text{H})$ parameters equal to $1.5U_{\text{eq}}(\text{C})$ for methyl H atoms and $1.2U_{\text{eq}}(\text{C},\text{N})$ for other H atoms.

Primary atom site location: structure-invariant direct methods	Flack parameter: 0.02 (7)

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
