Received 3 October 2011; accepted 17 October 2011

Key indicators: single-crystal X-ray study; T = 296 K; mean σ (C–C) = 0.003 Å; R factor = 0.039; wR factor = 0.109; data-to-parameter ratio = 15.1.

In the title compound, $C_{21}H_{21}FN_3O_2P$, the NH and P(=O) groups of the C(=O)NHP(=O) fragment are in a syn arrangement with respect to each other, as are the two amide H atoms of the two CH₃-4-C₆H₄-NH moieties. In the crystal, molecules are linked through N-H···O(=P) and N-H···O(=C) hydrogen bonds, forming $R_2^2(8)$ and $R_2^2(12)$ rings, which are arranged in chains parallel to [010].

N-(3-Fluorobenzoyl)-*N*',*N*''-bis(4-methylphenyl)phosphoric triamide

M. Pourayoubi, S. Shoghpour, G. Bruno and H. Amiri Rudbari

Comment

The possible hydrogen bond patterns in crystal structure of phosphoric triamides of the general formula $RC(O)NHP(O)[NR^{1}R^{2}]_{2}$ and $RC(O)NHP(O)[NHR^{1}]_{2}$ have been analyzed recently (Toghraee *et al.*, 2011) and the hydrogen bonds strengths in these systems were discussed based on cyclic hydrogen bond motifs (Pourayoubi et al., 2011). It was concluded that the $R_2^{2}(8)$ ring motif is generated by a pair of P(=O)···H-N_{C(O)NHP(O)} hydrogen bonds between two neighboring molecules in the crystal packing of phosphoric triamides of the formula $RC(O)NHP(O)[NR^1R^2]_2$ which contain a syn orientation of P(=O) versus N—H. In the case of phosphoric triamides of the formula $RC(O)NHP(O)[NHR^1]_2$, crystal structure is usually composed of a chain of $R_2^2(8)$ and $R_2^2(12)$ ring motifs which alternately connected to each other. However, a few other hydrogen bond patterns were also found. The $R_2^2(8)$ motif is formed by two P(=O)...H-N_{C(O)NHP(O)} hydrogen bonds and the $R_2^2(12)$ motif by two C(=O)···H-N_{amide} hydrogen bonds. In this work, the synthesis and crystal structure of a new phosphoric triamide, P(O)[NHC(O)C₆H₄(3-F)][NH-C₆H₄-4-CH₃]₂, is reported. This investigation was carried out as part of a comprehensive study on the hydrogen bonds pattern in phosphoric triamides with formula $RC(O)NHP(O)[NHR^{1}]_{2}$. The phosphorus atom has a distorted tetrahedral environment (Fig. 1). Comparison of the O-P-N angles indicates that the O-P-N1 angle is smaller than ideal tetrahedral (107.02 (7)°) and the O-P-N2 and O-P-N3 angles (113.75 (7)° and 116.29 (7)°, respectively) display larger than ideal values. This probably arises due to steric repulsion involving the P(=O) group. Moreover, there is no $\pi^{...}\pi$ interaction between the two *para*-methyl phenyl groups. The C(=O) and P(=O) groups of the C(=O)NHP(=O) moiety are in *anti* positions relative to each other, contrary to the *syn* orientation of P(=O) and NH groups. The P(=O), C(=O) and P-N bond lengths and P-N-C bond angles are in the range of the expected values. In the crystal structure, molecules are linked through $P(=O)\cdots H-N_{C(O)NHP(O)}$ and $C(=O)\cdots H-N_{amide}$ hydrogen bonds (Table 1), to give a linear chain running along the *b* axis.

Experimental

Synthesis of 3-F–C₆H₄C(O)NHP(O)Cl₂ A mixture of phosphorus pentachloride (3.773 g, 18.12 mmol) and 3-fluorobenzamide (2.521 g, 18.12 mmol) were refluxed in CCl₄ for 8 h, and then the resulting solution was cooled to the room temperature. Formic acid (0.834 g, 18.12 mmol) was syringed dropwise into the stirring solution in 20 min and stirred for 6 h to yield the white precipitate that was filtered and dried in vacuum.

Synthesis of the title molecule To a solution of $3-F-C_6H_4C(O)NHP(O)Cl_2$ (0.256 g, 1 mmol) in CHCl₃ (20 ml), a mixture of *p*-toluidine (0.214 g, 2 mmol) and triethylamine (0.202 g, 2 mmol) in CHCl₃ (5 ml) was added dropwise at 273 K. After 4 h stirring, the solvent was evaporated in vacuum and then the resulting solid was washed with distilled water. Single crystals of title compound were obtained from a mixture of CH₃OH, CH₃CN and n-C₆H₁₄ after slow evaporation at

room temperature. IR (KBr, cm⁻¹): 3355 (NH), 3313 (NH), 3081 (NH), 2921, 1651 (C=O), 1615, 1588, 1513, 1440, 1386, 1267, 1235, 1210, 961, 870, 861, 817, 751.

Refinement

All H atoms were placed in calculated positions with C—H = 0.93-0.96Å; N—H = 0.86Å and were included in a riding-model approximation with $U_{iso}(H) = 1.2U_{eq}(C,N)$ or $1.5U_{eq}(C_{methyl})$.

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2 , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.
