Received 27 October 2011; accepted 15 November 2011

Key indicators: single-crystal X-ray study; T = 291 K; mean σ (C–C) = 0.008 Å; R factor = 0.056; wR factor = 0.108; data-to-parameter ratio = 17.0.

The P atom in the title molecule, C₁₂H₂₆N₃OP, has a distorted tetrahedral configuration: its bond angles lie in the range 101.1 (2)–119.1 (2)°. The P–N bonds to the two cyclopentylamido moieties are significantly different [1.619 (4) and 1.643 (4) Å], with the shorter bond related to an anti orientation of the lone electron pair of the corresponding N atom relative to the P=O bond. The O atom of the P=O group acts as a double hydrogen-bond acceptor and is involved in two different intermolecular $N-H\cdots O(P)$ hydrogen bonds, building $R_2^2(8)$ rings that are further linked into chains along [001].

N,N'-Dicyclopentyl-N'',N''-dimethylphosphoric triamide

A. Raissi Shabari, M. Pourayoubi, F. Ghoreishi and B. Vahdani

Comment

The structure determination of the title molecule was done as part of a project on the synthesis of new phosphoric triamide compounds (Pourayoubi & Tarahhomi *et al.*, 2011) and their application as oxygen donor ligands (Pourayoubi & Golen *et al.*, 2011).

The P=O and P—N bond lengths and the C—N—P bond angles match those found for the other compounds having a $[(N)P(O)(N)_2]$ skeleton (Sabbaghi *et al.*, 2011).

The tetrahedral configuration of phosphorus atom (Fig. 1) is significantly distorted as it has also been noted for other phosphoric triamides: the bond angles at the P atom vary in the range from 101.1 (2) [N1-P1-N3] to 119.1 (2)° [O1-P1-N1].

The O atom of the P=O group acts as a double hydrogen-bond acceptor (Steiner, 2002); so, in the crystal structure, each molecule is hydrogen-bonded to two adjacent molecules by forming the $[N-H]_2\cdots O(P)$ grouping within a 1-D hydrogen-bonded arrangement parallel to the *c* axis (Fig. 2, Table 1).

Experimental

Synthesis of $((CH_3)_2N)P(O)Cl_2$: $[(CH_3)_2NH_2]Cl (0.184 mol)$ and $P(O)Cl_3 (0.552 mol)$ were refluxed for 8 h and afterwards the excess of $P(O)Cl_3$ was removed in vacuum.

Synthesis of title compound: a solution of cyclopentylamine (14.8 mmol) in CH_3CN (25 ml) was added to a solution of $((CH_3)_2N)P(O)Cl_2$ (3.7 mmol) in CH_3CN (15 ml) at 273 K. After stirring for 4 h, the solvent was removed and the product was washed with deionized water and recrystallized from CH_3CN at room temperature.

Refinement

The N-bound H atoms were found in difference Fourier map and then constrained to refine with the parent atoms with $U_{iso}(H)$ equal to $1.2U_{eq}(N)$. The remaining H atoms were positioned geometrically and constrained to refine in a riding-model approximation with $U_{iso}(H) = 1.2U_{eq}(C)$, or $1.5U_{eq}(methyl)$. A rotating group model was applied to the methyl groups.

Figures

Fig. 1. The molecular structure of the title compound with ellipsoids shown at the 50% probability level.

Fig. 2. A view of the crystal packing showing the formation of 1-D arrangement through N—H···O hydrogen bonds (shown as dashed lines). Carbon bound H atoms have been omitted for clarity.

Primary atom site location: structure-invariant direct methods	Flack parameter: -0.20 (18)

Special details

Experimental. IR (KBr, cm⁻¹): 3290, 3151, 2955, 2866, 2835, 2794, 1459, 1291, 1197, 1159, 1107, 1090, 1030, 993, 932, 889, 762, 703, 555, 496, 464.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2 , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
