It is well known that if G is a nilpotent (infinite) p-group of bounded exponent, then  $G \otimes G$  (resp.  $G \wedge G$ ) is also an (infinite) p-group. We study the converse under some restrictions.

## Non-abelian tensor square

#### Definition

• The tensor square  $G \otimes G$  of G is the special case of the non-abelian tensor product of two groups G and H when G = H, and G acts on itself by conjugation.

→ 同 → → 目 → → 目 →

## Non-abelian tensor square

#### Definition

- The tensor square  $G \otimes G$  of G is the special case of the non-abelian tensor product of two groups G and H when G = H, and G acts on itself by conjugation.
- The exterior square  $G \land G$  is obtained by imposing the additional relation  $g \otimes g = 1_{\otimes}$  on  $G \otimes G$ .

・ 同 ト ・ ヨ ト ・ ヨ ト

## Some known results

The tensor square and exterior square of G inherit many properties from G; for example, if G is finite, a p-group, nilpotent, solvable, polycyclic, or locally finite, then so are  $G \otimes G$  and  $G \wedge G$  [5, 3, 4, 5, 2].

# Partial answer

• We prove that for a group G with finitely generated abelianization,  $G \otimes G$  is a p-group if and only if G is a p-group. We show that the condition that  $G^{ab}$  be finitely generated is essential and cannot be removed.

・ 同 ト ・ ヨ ト ・ ヨ ト

- We prove that for a group G with finitely generated abelianization, G ⊗ G is a p-group if and only if G is a p-group. We show that the condition that G<sup>ab</sup> be finitely generated is essential and cannot be removed.
- The structure of a group whose exterior square is a *p*-group, is a semidirect product of a *p*-group by a cyclic one, but the conditions under which we can deduce this fact are more than that for the tensor square.

### Exterior squares: Finite case

#### We need this...

• Lemma: Let G be a finite group whose commutator subgroup is a p-group for some prime p. Then G is a semidirect product of P, the unique Sylow p-subgroup of G, by H in which |H| and p are coprime.

Mohsen Parvizi Department of Pure Mathematics, Ferdowsi U On the structure of groups whose exterior or tensor square is a

3

We recall a result of Tahara [6, Corollary 2.2.6]:

#### ...and this

• Lemma: Let G be the semidirect product of N by H, where |N| and |H| are coprime. Then

$$\mathcal{M}(G) \cong \mathcal{M}(N)^H \oplus \mathcal{M}(H),$$

where  $\mathcal{M}(N)^H$  is the *H*-stable subgroup of  $\mathcal{M}(N)$ .

#### Theorem

 Let G be a finite group. Then G ∧ G is a p-group if and only if G is a semidirect product of a p-group by a cyclic group of order coprime to p.

向下 イヨト イヨト

#### Theorem

 Let G be a finite group. Then G ∧ G is a p-group if and only if G is a semidirect product of a p-group by a cyclic group of order coprime to p.

The last theorem shows that in finite case, if  $G \wedge G$  is a *p*-group, then *G* need not to be a *p*-group. In this case even in general,  $G/Z^{\wedge}(G)$  is not a *p*-group.

The following theorem states conditions for a finite group G to conclude  $G/Z^{\wedge}(G)$  being a p-group.

3

The infinite case is not as straightforward as the finite case. In the following Lemma and Theorem we assume that  $G \wedge G$  is a *p*-group and try to describe the structure of *G*. Of course we need to impose some restrictions on *G*, however we will show these restrictions are essential. First for the abelian case we have:

< 同 > < 臣 > < 臣 > -

## Exterior squares: Infinite case

#### Lemma

Let G be a finitely generated abelian group such that  $G \wedge G$  is a p-group, then G is the direct sum of a finite p-group and a cyclic group either of infinite order or of finite order coprime to p.

Mohsen Parvizi Department of Pure Mathematics, Ferdowsi U On the structure of groups whose exterior or tensor square is a

The following example shows that the condition on  $G^{ab}$  to be finitely generated is essential.

・ロト ・回ト ・ヨト ・ヨト

3

The following example shows that the condition on  $G^{ab}$  to be finitely generated is essential.

#### Example

Let  $G = \mathbb{Z}(q^{\infty}) \times \mathbb{Z}_p \times \mathbb{Z}_p$  in which p and q are distinct primes and  $\mathbb{Z}(q^{\infty})$  is a quasicyclic q-group. Since  $\mathbb{Z}(q^{\infty})$  is a divisible torsion group, we have  $\mathbb{Z}(q^{\infty}) \otimes \mathbb{Z}_p = \mathbb{Z}(q^{\infty}) \otimes \mathbb{Z}(q^{\infty}) = 0$  so  $G \wedge G \cong \mathbb{Z}_p$  is a p-group, but G is not as the form introduced in the last theorem.

(日) (同) (E) (E) (E)

To prove a converse of the previous theorem, we need to put some extra restrictions on groups. Recall from [1] the relative Schur multiplier of a pair of groups (G, N) is denoted by  $\mathcal{M}(G, N)$ . In the next contribution we need the following lemma, whose proof can be found in [1].

To prove a converse of the previous theorem, we need to put some extra restrictions on groups. Recall from [1] the relative Schur multiplier of a pair of groups (G, N) is denoted by  $\mathcal{M}(G, N)$ . In the next contribution we need the following lemma, whose proof can be found in [1].

#### Lemma

Let G be the semidirect product of N by Q. Then

(i)  $\mathcal{M}(G) \cong \mathcal{M}(G, N) \oplus \mathcal{M}(Q)$ 

(ii) 
$$\mathcal{M}(G, N) \cong \ker \left( \mu : \mathcal{M}(G) \twoheadrightarrow \mathcal{M}(Q) \right)$$

Exterior squares: Infinite case

We also need the following Theorem which comes from [4, Proposition 2.8].

・ロン ・回 と ・ ヨン ・ ヨン

æ

We also need the following Theorem which comes from [4, Proposition 2.8].

#### Theorem

Let G be a group and N a locally finite normal subgroup of G. If exponent of N is n, then the exponent of  $\mathcal{M}(G, N)$  is n-bounded.

・ 母 と ・ ヨ と ・ ヨ と

We are in a position to decide whether for the groups presented as a semidirect product, the exterior square is a p-group. But the conditions differs as follows.

▲圖▶ ★ 国▶ ★ 国▶

3

We are in a position to decide whether for the groups presented as a semidirect product, the exterior square is a p-group. But the conditions differs as follows.

#### Theorem

Let G be the semidirect product of a p-group P by an abelian group C. If  $\mathcal{M}(C) = 0$ , P/G' is of finite exponent, and G' is locally finite of finite exponent, then  $G \wedge G$  is a p-group.

Exterior squares: Infinite case

Now we can obtain the following.

Mohsen Parvizi Department of Pure Mathematics, Ferdowsi U On the structure of groups whose exterior or tensor square is a

・ロン ・回と ・ヨン・

æ

Now we can obtain the following.

#### Theorem

Let G be a group with the following properties:

(i) G' is of finite exponent and locally finite;

```
(ii) G/G' is finite.
```

Then  $G \wedge G$  is a *p*-group if and only if  $G = C \ltimes P$ , where *P* is a finite *p*-group and *C* is a cyclic group of infinite order or of order coprime to *p*.

・ロン ・回と ・ヨン ・ヨン

#### Tensor squares: Abelian case

The analogous theorem for  $G \otimes G$  gives a more restrictive structure for G. Again we start with abelian groups.
