Acta Crystallographica Section E: Structure Reports Online is the IUCr's highly popular open-access structural journal. It provides a simple and easily accessible publication mechanism for the growing number of inorganic, metal-organic and organic crystal structure determinations. The electronic submission, validation, refereeing and publication facilities of the journal ensure very rapid and high-quality publication, whilst key indicators and validation reports provide measures of structural reliability. The journal publishes over 4000 structures per year. The average publication time is less than one month.

Received 23 July 2012; accepted 18 September 2012

Key indicators: single-crystal X-ray study; $T = 173\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; disorder in main residue; R factor = 0.051; wR factor = 0.122; data-to-parameter ratio = 20.8.

In the title molecule, $\text{C}_{16}\text{H}_{17}\text{ClF}_2\text{N}_3\text{O}_2\text{P}$, the N–H unit of the $\text{C}(=\text{O})\text{NHP}(=\text{O})$ fragment adopts a *syn* orientation with respect to the $\text{P}=\text{O}$ group. The two F atoms and the Cl atom of the ClF_2C group are disordered over two sets of sites with refined occupancies of 0.605 (6) and 0.395 (6). In the crystal, molecules are linked via $\text{N}-\text{H}\cdots\text{O}=\text{C}$ hydrogen bonds and the $(\text{N}-\text{H}\cdots)(\text{N}-\text{H}\cdots)\text{O}=\text{P}$ group into chains along [010].

Related literature

N,N'-Dibenzyl-N''-(2-chloro-2,2-difluoroacetyl)phosphoric triamide

Mehrdad Pourayoubi, Mojtaba Keikha, Jerry P. Jasinski and Amanda C. Keeley

Comment

In the previous studies, the structures of some compounds with a $\text{P}(\text{O})[\text{NHC}(\text{O})\text{CClF}_2]$ fragment have been investigated; for example, $[\text{4-CH}_3\text{-C}_6\text{H}_4\text{NH}]_2\text{P}(\text{O})[\text{NHC}(\text{O})\text{CClF}_2]$ (Pourayoubi, Tarahhomni *et al.*, 2011), $[(\text{C}_6\text{H}_5\text{CH}_2)(\text{CH}_3)\text{N}]_2\text{P}(\text{O})[\text{NHC}(\text{O})\text{CClF}_2]$ (Raissi Shabari *et al.*, 2011) and $[(\text{CH}_3)_2\text{CHNH}]_2\text{P}(\text{O})[\text{NHC}(\text{O})\text{CClF}_2]$ (Pourayoubi & Saneei, 2011). Here, the structure determination of the title compound (Fig. 1) is reported.

Atoms F1, F2 and Cl1 were refined as disordered over two sets of sites with occupancies of 0.605 (6) and 0.395 (6). The N—H unit of the $\text{C}(\text{O})\text{NHP}(\text{O})$ fragment adopts a *syn* orientation with respect to the phosphoryl group. The P atom is bonded in a distorted tetrahedral environment as has been noted for other phosphoric triamides. The $\text{P}=\text{O}$, $\text{C}=\text{O}$ and $\text{P}-\text{N}$ bond lengths and $\text{P}-\text{N}-\text{C}$ bond angles are within the expected values (Pourayoubi, Tarahhomni *et al.*, 2011; Raissi Shabari *et al.*, 2011; Pourayoubi & Saneei, 2011).

In the crystal, the O atom of $\text{P}=\text{O}$ group acts as a double-hydrogen bond acceptor (Pourayoubi *et al.*, 2012) and molecules are linked by $\text{N}-\text{H}\cdots\text{O}=\text{C}$ hydrogen bonds and $(\text{N}-\text{H}\cdots\text{O})_2\text{P}=\text{O}$ group, into a linear arrangement along the *b* axis (Fig. 2).

Experimental

$\text{ClF}_2\text{CC}(\text{O})\text{NHP}(\text{O})\text{Cl}_2$ was prepared according to the literature method reported by Iriarte *et al.* (2008).

To a solution of $\text{ClF}_2\text{CC}(\text{O})\text{NHP}(\text{O})\text{Cl}_2$ (0.473 g, 1.92 mmol) in dry chloroform (25 ml), a solution of benzylamine (0.823 g, 7.68 mmol) in the same solvent (5 ml) was added at 273 K. After 6 h stirring, the solvent was removed and the product was washed with distilled water and recrystallized from CH_3CN at room temperature.

Refinement

H atoms H1N, H2N and H3N were located in a difference Fourier map and were refined with $\text{U}_{\text{iso}}(\text{H}) = 1.2\text{U}_{\text{eq}}(\text{N})$, giving N—H distances of 0.88 (2) or 0.86 (2) Å. The other H atoms were placed in calculated positions with 0.95 Å for CH, 0.99 Å for CH_2 and with $\text{U}_{\text{iso}}(\text{H}) = 1.2\text{U}_{\text{eq}}(\text{C})$. F atoms F1 and F2 and chlorine Cl1 are disordered over two sets of sites with occupancies of 0.605 (6) and 0.395 (6).

Computing details

Data collection: *CrysAlis PRO* (Oxford Diffraction, 2010); cell refinement: *CrysAlis PRO* (Oxford Diffraction, 2010); data reduction: *CrysAlis RED* (Oxford Diffraction, 2010); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *SHELXTL* (Sheldrick, 2008); software used to prepare material for publication: *SHELXTL* (Sheldrick, 2008) and *enCIFer* (Allen *et al.*, 2004).

**Figure 1**

The molecular structure of the title compound. Displacement ellipsoids are given at the 30% probability level and H atoms are drawn as small spheres of arbitrary radii. The atoms of the minor component of disorder are labeled with suffix 'A'.

**Figure 2**

Crystal packing of title compound viewed approximately along the a axis. The $\text{N}—\text{H}···\text{O}$ hydrogen bonds are shown by dashed lines. H atoms not involved in hydrogen bonding have been removed for clarity.

$0.35 \times 0.22 \times 0.12$ mm

Data collection

Oxford Xcalibur (Eos, Gemini) diffractometer
 Radiation source: Enhance (Mo) X-ray Source
 Graphite monochromator
 Detector resolution: 16.1500 pixels mm⁻¹
 ω scans
 Absorption correction: multi-scan (*CrysAlis RED*; Oxford Diffraction, 2010)
 $T_{\min} = 0.890$, $T_{\max} = 0.960$

Refinement

Refinement on F^2
 Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.051$
 $wR(F^2) = 0.122$
 $S = 1.09$
 5460 reflections
 263 parameters
 18 restraints
 Primary atom site location: structure-invariant direct methods
 Secondary atom site location: difference Fourier map

9633 measured reflections
 5460 independent reflections
 4909 reflections with $I > 2\sigma(I)$
 $R_{\text{int}} = 0.025$
 $\theta_{\max} = 32.2^\circ$, $\theta_{\min} = 3.3^\circ$
 $h = -18 \rightarrow 19$
 $k = -7 \rightarrow 6$
 $l = -9 \rightarrow 20$

Hydrogen site location: inferred from neighbouring sites
 H atoms treated by a mixture of independent and constrained refinement
 $w = 1/[\sigma^2(F_o^2) + (0.048P)^2 + 0.3968P]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} = 0.001$
 $\Delta\rho_{\max} = 0.55 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.71 \text{ e } \text{\AA}^{-3}$
 Absolute structure: Flack (1983), with 2216 Friedel pairs
 Flack parameter: 0.06 (11)

Special details

Experimental. IR (KBr, ν , cm⁻¹): 3253, 1718, 1457, 1419, 1282, 1215, 1139, 1073, 977, 873, 735 and 688.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
