# New Organotin(IV)-Phosphoramidate Complex: Cis-Dichlorido-Trans-Dimethyl-Cis-Bis( $N, N^{\prime}, N^{\prime \prime}$-Tricyclopentylphosphoric Triamide)Tin(IV) 

Atekeh Tarahhomi ${ }^{*}{ }^{, a}$, Mehrdad Pourayoubi ${ }^{*}$,a<br>Department of Chemistry, Ferdowsi University of Mashhad, Mashhad, Iran

Organotin (IV) compounds have been attracted to exhibit wide biological activity [1,2]. In recent report by our group, the coordination of phosphoryl ligands containing the $\mathrm{RNH}-\mathrm{P}(\mathrm{O})$ group to organotin chloride was investigated in solid state structures where the domination of $\mathrm{N}-\mathrm{H} \ldots \mathrm{O}=\mathrm{P}$ hydrogen bonds in crystal packing of the free ligands is broken and permits weaker HBs to stabilize the crystal packing [3]. In this work, we report the synthesis and crystal structure of a new organotin(IV)-phosphoramidate complex containing a $\left[\mathrm{C}_{5} \mathrm{H}_{9} \mathrm{NH}\right]_{3} \mathrm{PO}$ phosphoric triamide ligand, $\left\{\mathrm{Sn}\left[(\mathrm{O}) \mathrm{P}\left(\mathrm{NHC}_{5} \mathrm{H}_{9}\right)_{3}\right]_{2}\left(\mathrm{CH}_{3}\right)_{2} \mathrm{Cl}_{2}\right\}$ which is one of the few examples of organotin(IV) tris(alkylamido)phosphate complexes with two phosphoric triamide ligands in cis positions.

The asymmetric unit in cis-dichlorido-trans-dimethyl-cis-bis $\left(N, N^{\prime}, N^{\prime \prime}\right.$ tricyclopentylphosphoric triamide)tin(IV) consists of three crystallographically independent molecules. The $\mathrm{Sn}^{\mathrm{IV}}$ coordination geometry is octahedral with two cis phosphic triamide ligands, two cis chloride ligands and two trans methyl groups. The environment of each N atoms in the phosphoryl donor (PO) ligands $\left(\mathrm{C}_{5} \mathrm{H}_{9} \mathrm{NH}\right)_{3} \mathrm{P}=\mathrm{O}$ is almost planar and it does not form any hydrogen bonds as acceptor, showing its low Lewis-base character. The P atom in $\left(\mathrm{C}_{5} \mathrm{H}_{9} \mathrm{NH}\right)_{3} \mathrm{P}=\mathrm{O}$ adopts a slightly distorted tetrahedral environment. The $\mathrm{Sn}-\mathrm{O}, \mathrm{Sn}-\mathrm{Cl}$ and $\mathrm{Sn}-\mathrm{C}$ bond distances are within exepted values [4]. In the crystal, molecules are aggregated through $(\mathrm{N}-\mathrm{H})_{2} \ldots \mathrm{Cl}$ hydrogen bonds, forming 1 D chain in which the Cl atoms acts as a double hydrogen-bond acceptor. The intramoleculat $\mathrm{N}-\mathrm{H} \ldots \mathrm{O}(\mathrm{P})$ hydrogen bonds, between the amide group of one ligand and the phosphoryl O atom of the other ligand, are also find in the structure.
